

3.4 Other Label Resources Script

Pesticide manufacturers, local Cooperative Extension offices, land-grant universities, state and federal pesticide regulatory agencies, and professional pest management associations create additional resources to help you understand the label and the product that is being sold. However, these additional resources do not replace the label. You are still bound by the information that is found on the label of the product container.

Often times the labels include very technical and complex wording that is difficult to understand. You can use leaflets or bulletins that explain the technical language in easier-to-understand terms.

Another resource is the NPAC Core Manual's Glossary of terms. You will find a link at the bottom of this page.

Many manufacturers will include a website that has more information about the product. If a manufacturer includes a website on the label that contains additional precautions or instructions, you will be responsible to view the website. You will be required to follow the information found on the website. If the address is no longer available, you need to contact the manufacturer.

The EPA, state or territory regulatory agencies, Extension Services, consulting companies, etc., are starting to provide sample labels online with more information.

You need to be aware that some companies are moving toward putting their product labels online. The advantage to having labels online is to have up-to-date information available more quickly than printing and distributing the information.

Check online resources frequently so you are aware of the updates.
